

SMARTS HTTP Server

This documentation describes the HTTP server component of the Software AG Multiple Architecture Runtime System (SMARTS) environment. It includes the following documents:

General Information

	Introduction to the HTTP Server	Introduces you to the HTTP Server, including the CGI programming concept.
---	---------------------------------	---

Installation and Configuration

	General Installation Information	Describes the required environments for installing the HTTP server, the prerequisite software, the distribution media, and the general installation process.
	Installation on OS/390 or MVS	Describes the installation procedure on MVS or OS/390 systems.
	Installation on VSE/ESA	Describes the installation procedure on VSE/ESA systems.
	Verifying the Installation	Describes how to verify successful installation and gives troubleshooting information.
	Customizing and Using the HTTP Server	Describes how to initialize, customize and use the HTTP Server.
	Installing NATURAL CGI	Describes the environment and installation procedures to enable Natural CGI processing.

Reference and Maintenance

	Security	
	Programming CGI Requests	Describes the CGI interface modules and how to call them.
	Running CGI Programs under SMARTS	Provides information about running application programs under SMARTS.
	Support and Maintenance	Describes the procedure for reporting problems and applying ZAPS.
	The HTTP Server User Exit	Describes the user exit interface.
	Messages and Codes	Explains messages and codes issued by the HTTP server components of the SMARTS system, including remedial information.
	Sample Members	Lists the supplied sample jobs and tells you what they are used for.
